HANDLE-SLIDE UNLINK ORBIT REDUCTION ON STAGED-FRAMING TWO-COMPONENT LINK PRESENTATIONS

ARGUS OPEN RESEARCH PROJECT

Abstract. The Generalized Property R conjecture asserts that any n-component link yielding $\#_n(S^1 \times S^2)$ by 0-framed surgery is handle-slide equivalent to the n-component unlink. For the two-component staged-framing construction with terminal scalar $\lambda(1)^2 = 0$, we prove that under the prescribed three-type handle-slide transport, the terminal presentation reduces to the standard two-component unlink U_2.

1. Main Orbit Reduction

Proposition 1.1. *In the verified two-component staged-framing presentation with zero-framed terminal U_2 and $\lambda(1)^2 = 0$, the partial-filling handle-slide transport carries the link into the ordinary handle-slide orbit of the two-component unlink U_2.*
