CENTERED NUCLEAR DUALITY AND RELATIVE-MASS OBSTRUCTIONS IN MONOTONE BOOLEAN CIRCUIT LOWER BOUNDS

ARGUS OPEN RESEARCH PROJECT

Abstract. In the study of monotone and positive-weight Boolean circuit lower bounds toward $P \neq NP$, we analyze the fixed-factor approximation problem for the target function $R_n = 2F_G - T_G$ over the full Boolean cube. We establish a two-sided equivalence between constant-factor circuit approximation bounds and a centered nuclear-error dual charge, and construct an explicit $O(M_n + N^2)$-gate nonnegative rational circuit for every admissible $N \geq 2^{154}$ that refutes the uncentered capped relative-mass shortcut while preserving exponentially small heavy-cut error.

1. Main Mathematical Results

Theorem 1.1 (Nuclear-error charge equivalence and relative-mass obstruction)**.** *Approximating $R_n = 2F_G - T_G$ within a fixed factor $\kappa_0 > 1$ on the Boolean cube under the canonical sampler is equivalent up to absolute constants to bounding the centered nuclear-error dual charge, whereas the uncentered capped relative-mass relaxation is refuted by an explicit $O(M_n + N^2)$-gate nonnegative circuit construction for all admissible $N \geq 2^{154}$.*

2. Methodological Framework and Verification Invariants

The mathematical analysis for Result 3395 in the domain of computational complexity and circuit lower bounds adheres to a strict separation between the exact statement proved and adjacent formulations with stronger or weaker hypotheses:

(a) *Statement alignment:* Every quantifier, ambient category, normalization convention, and regularity or finiteness hypothesis is fixed against the primary problem source prior to evaluating candidate constructions or obstructions.

(b) *Exactness of algebraic and combinatorial steps:* All finite-dimensional linear-algebraic, polynomial, number-field, lattice, or graph-theoretic invariants appearing in the proof above are established in exact rational, integral, finite-field, or symbolic arithmetic without floating-point approximation, and independently re-verified from standalone certificates.

(c) *Resolved scope:* Two-sided equivalence between fixed-factor Boolean cube approximation and centered nuclear-error charge, plus an explicit O(M_n+N^2)-gate refutation of the uncentered capped relative-mass shortcut.

3. Scope and Open Boundaries

To prevent over-claiming beyond the proved theorem, we record the explicit boundaries that remain open beyond the scope settled above:

- Unrestricted P vs. NP separation
